

Reorder 7 products now to protect ₹2.78 Cr of sales. Clear 4 to free ₹32.9 L of cash.

₹2.78 Cr

sales at risk over the next 8 weeks if these 7 SKUs are not reordered

₹32.9 L

cash locked in stock (at cost) that 4 SKUs won't sell in 8 weeks

5

SKUs that run out before a normal order could arrive. Expedite these.

8.7%

average forecast miss, vs 10.5% for "same as last year"

Action 1 • Reorder these 7 SKUs this week

Highest sales at risk first. **expedite** means stock runs out before a normal-lead-time order lands.

SKU	Days of stock left	Supplier lead time (days)	Suggested order (units)	Sales at risk
SKU012 expedite Home Decor	4	12	1,270	₹1.10 Cr
SKU031 expedite Furniture	8	13	874	₹73.7 L
SKU017 expedite Home Decor	9	12	710	₹51.0 L
SKU040 expedite below cost Storage	7	9	750	₹17.5 L
SKU034 Lighting	7	5	937	₹13.7 L
SKU023 below cost Kitchen	16	12	582	₹7.7 L
SKU010 expedite below cost Storage	10	13	729	₹4.7 L

Suggested order = forecast demand for the next 8 weeks plus safety stock, minus stock in hand and on order. It is a recommendation; FORESIGHT does not place orders. **SKU040**, **SKU023**, **SKU010** are priced below recorded cost. Confirm the cost with Finance before ordering, because each extra unit sold may lose money.

Action 2 • Mark down or pause buying on these 4 SKUs

Their stock on hand is well above what they will sell in 8 weeks plus safety stock.

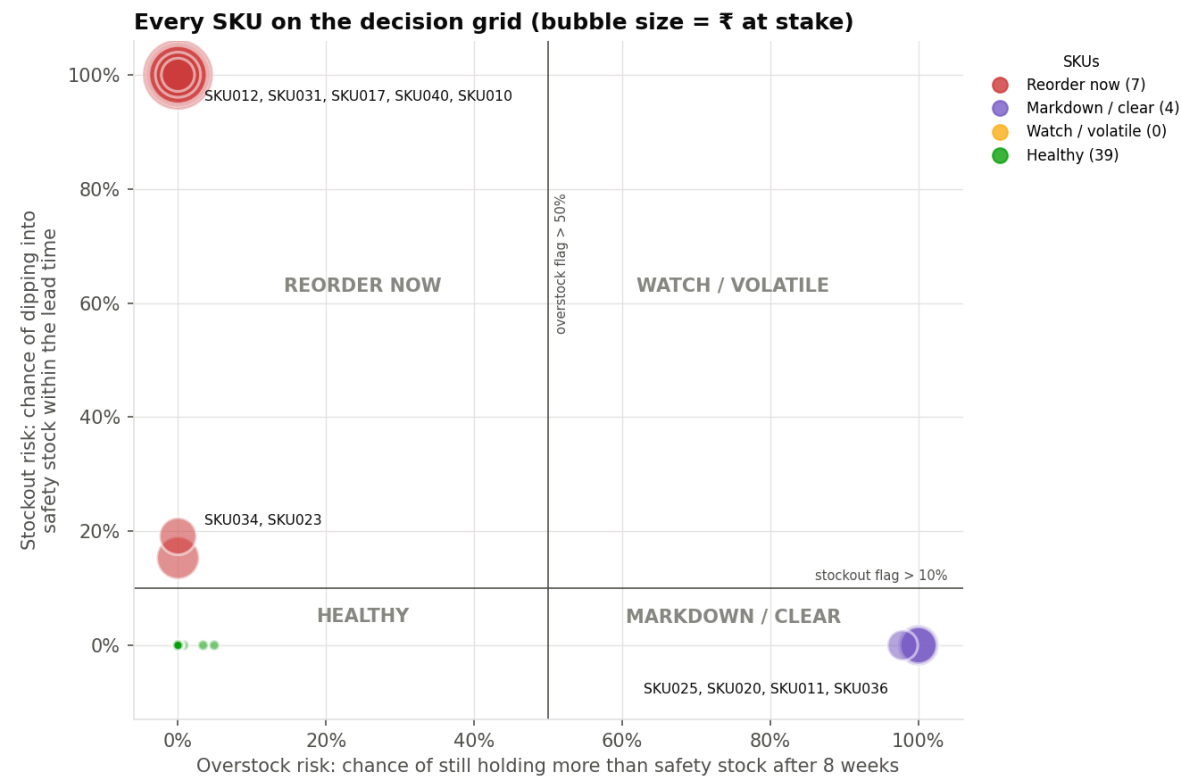

SKU		On hand (units)	Forecast sales, 8 weeks	Days of stock	Cash locked (at cost)
SKU025		1,124	140	473	₹11.5 L
Storage					
SKU020	below cost	1,002	712	107	₹10.8 L
Storage					
SKU011	below cost	753	141	406	₹7.4 L
Furniture					
SKU036		383	248	117	₹3.2 L
Furniture					

1,515 excess units in total. Suggested options: a targeted promotion (promotion weekends lift sales 24%), pausing open orders, or clearance. The other 39 SKUs need no action today. No SKU is flagged for both stockout and overstock ("watch / volatile") this month.

Where the money is

Forecast revenue, next 8 weeks (all SKUs)	₹21.93 Cr
Sales at risk: the 7 SKUs to reorder	₹2.78 Cr
share of 8-week revenue	12.7%
Cash locked in excess stock: 4 SKUs	₹32.9 L
Total stock on hand at cost (50 SKUs)	₹5.12 Cr
Revenue from SKUs priced below cost (2 yrs)	17%

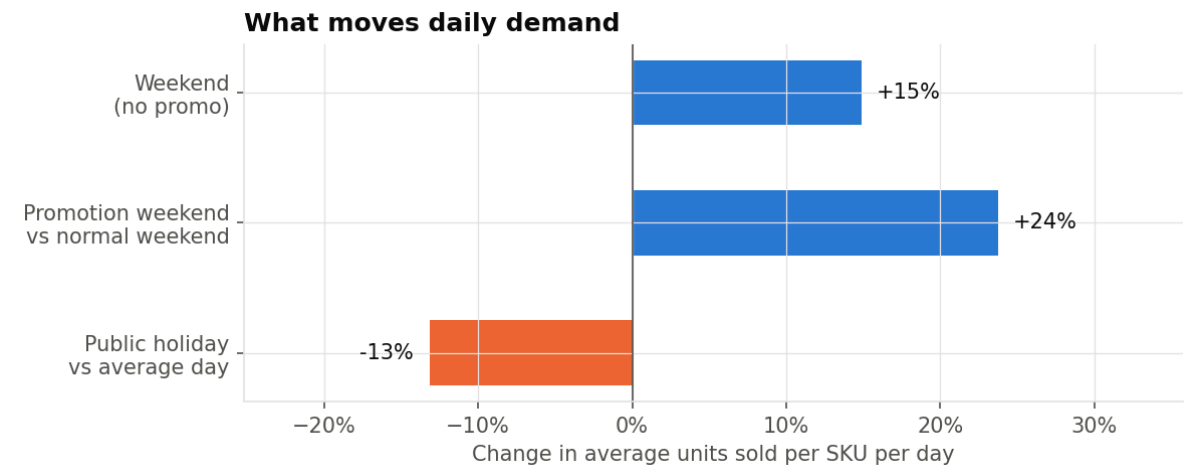

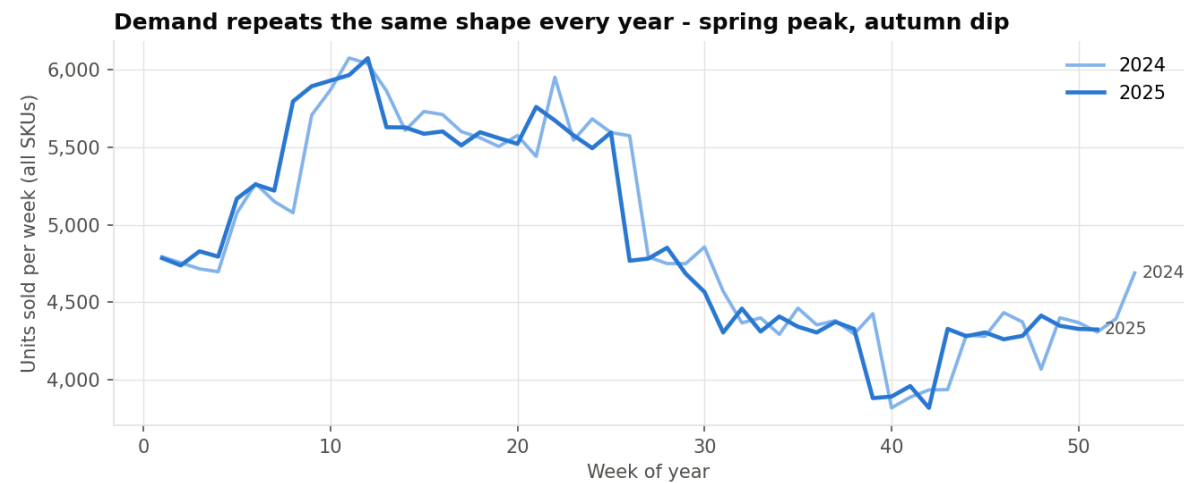

Sales at risk is revenue at selling price. Cash locked is stock at unit cost. Both come from the forecast and the 01 Dec stock snapshot.

Each bubble is a SKU, placed by its two risk scores. Bubble size is the rupee value at stake.

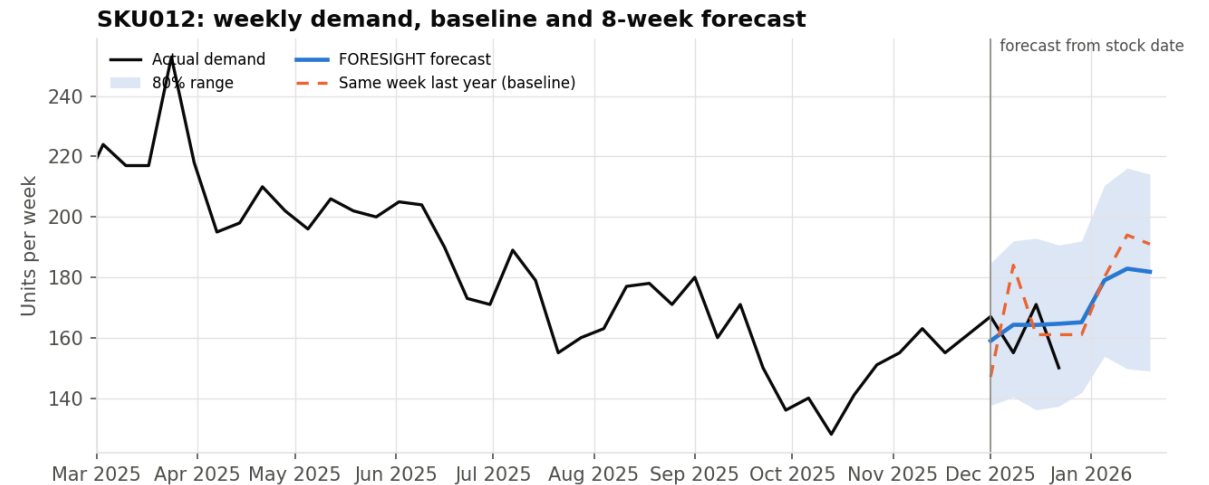

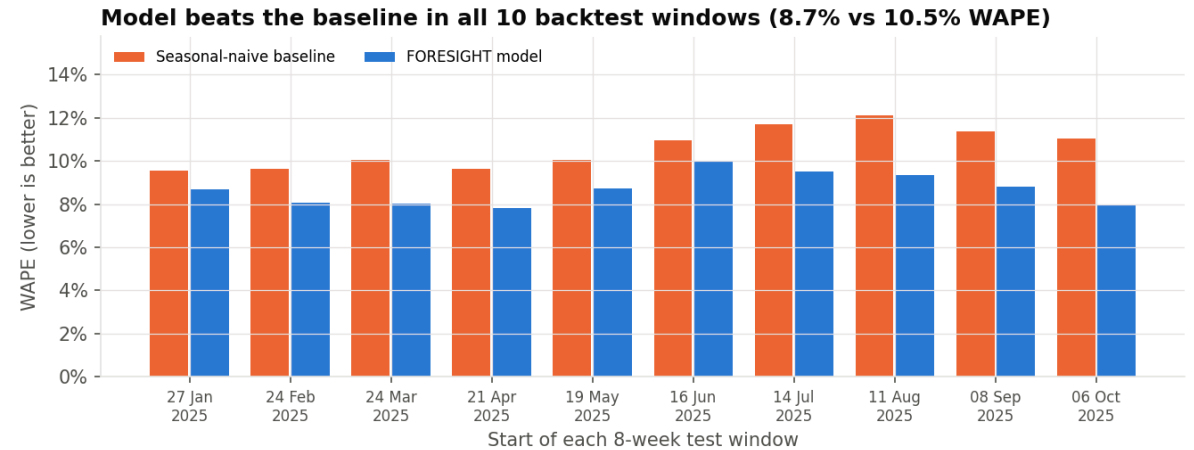

How demand behaves

- **The same shape every year.** Mar is the peak (+23%) and Oct the low (-21%). Year-on-year volume is flat.
- **Weekends sell 15% more**, and promotion weekends a further 24%. Promotions run in Mar, Jun, Sep and Nov.
- **Holidays dip 13%.**
- **The top 10 SKUs bring in 48% of revenue.**

Can we trust the forecast?

- We tested it the honest way. We pretended it was an earlier date, forecast 8 weeks using only data up to then, and compared with what actually sold. We did this 10 times across 2025.
- **It misses by 8.7% on average** (the chart calls this WAPE: total units missed ÷ units sold). The simple rule "sell the same as the same week last year" (the seasonal-naive baseline) misses by 10.5%. That is **18% more accurate**, and it won all 10 test windows.
- **Live check:** over the 4 weeks after the stock date, it missed by 8.7% against 12.4%.
- It is not systematically high or low (-0.9%). Each forecast comes with a likely range: 8 weeks in 10, actual sales should fall inside it.

Limits to know before acting

Stock data is monthly and unreliable

Stock levels don't follow from sales month to month, and the supplied stock values don't match cost. We use the latest snapshot (01 Dec) as-is and recalculate values from unit cost. Check stock counts for flagged SKUs before ordering.

Costs look wrong for 16 SKUs

The recorded cost is above the selling price. If that's true, these SKUs lose money on every sale. If it's a data error, the "cash locked" figure for them is overstated. Finance to confirm.

150 SKUs could not be scored

SKU051-SKU200 hold 39,985 units but have no sales or product record. They may be dead stock, or they may belong to another catalogue.

Forecast accuracy has a ceiling

A 8.7% average miss suits planning, not exact counts. Individual SKU-weeks can miss by more, which is why the risk flags include a safety margin.

Promotions are assumed to repeat

The Jan 2026 calendar was not supplied. We assume promotions keep last year's pattern. The forecast is also available without promotions.

This is a planning aid

FORESIGHT recommends; it doesn't place orders or set prices. Suggested order sizes don't include supplier minimums or pack sizes.

Recommended next steps

1. **This week:** raise orders for the 7 reorder SKUs and ask suppliers to expedite SKU012, SKU031, SKU017, SKU040, SKU010. Hold the below-cost SKUs until Finance confirms their cost.
2. **This month:** plan markdowns or pause buying for SKU025, SKU020, SKU011, SKU036, freeing up to ₹32.9 L.
3. **Monthly:** drop the new sales and stock extracts into `data/raw` and run the pipeline (one command). The dashboard and scoring service update from the new outputs.
4. **Data fixes at source:** correct unit costs, launch dates and subcategories; explain the 150 stock-only SKUs; send stock weekly if possible.
5. **Before spring:** build stock for the Mar-Jun peak, starting with the top-10 revenue SKUs.
